CONCRETE-STEEL A TREATISE ON THE THEORY AND PRACTICE OF REINFORCED CONCRETE CONSTRUCTION

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 60 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1905 edition. Excerpt: . . . the lower part of the beam is drawn in broken lines. Let b breadth of the beam $5d$ depth from top of beam to axis of reinforcement clear span between supports S_x distance between assumed diagonals 10 in. w load per inch of length 100 lb. 10 in. 80 in. The load applied upon the top of the beam is practically equivalent, so far as concerns stress on the assumed diagonals, to downward vertical forces equal to w_x , acting at each of the points, a_2, a_3, a_4 , and downward forces equal to w_x , acting at the points a, a . The total tensile stresses along the diagonals may be ascertained by adding together the stresses due to the different weights, or by the simple rule, $P, \dots 1 wS_x \sec 6 (45)$ Where P_e total tensile stress in any diagonal, N number of bays formed by assumed diagonals, n -numerical order of any bay from the abutment, θ inclination of assumed diagonals. In this case the inclination of the diagonals to the horizontal is 45 deg. , and the value of $\sec 1.41421$, say 1.414 . The value of $wS_x 100 \times 10 1,000 \text{ lb.}$ Calculating the tensile stresses in the diagonals for one half of the beam, we have. $(8-2 \times l) l. a b_4, Vt -x (1,000 \times 1.414) 4,949 \text{ lb.}; 1,000 \times 1.414) 707 \text{ lb.}$ Dividing each of these results by the area of the...
